Eliminate Vehicular Heatstroke

On average, 37 children die each year from vehicular heatstroke

When a child's temperature reaches 107 degrees- **THEY DIE**

A circular infographic with a sun in the center. The sun contains the text: "It only takes a car 10 minutes to heat up 20 degrees and become deadly. Cracking a window does not protect your child." The sun is surrounded by four segments, each representing a temperature increase and a car icon: 20 degrees (orange, top-left), 5 degrees (blue, top-right), 10 degrees (dark blue, bottom-right), and 15 degrees (grey, bottom-left).
